

ABSTRACT

The reinforcing fiber sheet of the present invention has a cloth core 4 that includes a cloth layer 13 constructed of vertically and horizontally woven vertical strips 11 and horizontal strips 12 which are assemblages of numerous reinforcing fibers, and a binding and reinforcing layer 14 impregnated into the cloth layer 13 so as to allow the cloth layer 13 to deform at ordinary room temperature with the vertical strips 11 and horizontal strips 12 remaining in a mutually bonded state. This cloth core 4 is embedded in a matrix resin and used in this way as a reinforcing material for molded articles, or a synthetic resin high-stretch sheet material that is transparent and has good stretch is permanently bonded to the cloth core 4 and the resulting assembly is used as a material for dress-up sheets.
